

CLAIMS

1. An electronic device comprising:

an IC chip; and

5 a light shielding member for preventing incidence of light to the IC chip;

wherein the light shielding member is provided with an indication of information regarding the electronic device.

10 2. The electronic device according to claim 1, further comprising an image display area controlled by the IC chip.

3. The electronic device according to claim 1, further comprising a transparent base plate that includes a first 15 surface on which the IC chip is mounted and a second surface opposite to the first surface,

wherein at least a part of the light shielding member is attached to the second surface.

20 4. The electronic device according to claim 3, further comprising a wiring connecting member connected to the base plate;

wherein the light shielding member is attached to both the base plate and the wiring connecting member.

25

5. The electronic device according to claim 1, wherein the light shielding member is a dark color, and the information

is indicated with ink of a dark color different in lightness from the light shielding member.

6. The electronic device according to claim 1, wherein the
5 information is indicated by a code symbol.

7. A method of manufacturing an electronic device, the method comprising the steps of: attaching a light shielding member to a base plate for preventing incidence of light to an IC
10 chip mounted on the base plate; and printing desired information on the light shielding member;

wherein the printing of the information is performed prior to the attaching of the light shielding member.
